ZEISS Elyra 7
Your Flexible Platform with Lattice SIM for Fast and Gentle 3D Superresolution
Your Flexible Platform with Lattice SIM for Fast and Gentle 3D Superresolution

Life sciences research often requires you to measure, quantify and understand the finest details and sub-cellular structures of your sample. You may be working with tissue, bacteria, organoids, neurons, living or fixed cells and many different labels. Elyra 7 takes you beyond the diffraction limit of conventional microscopy to image your samples with superresolution. You can examine the fastest processes in living samples – in large fields of view, in 3D, over long time periods, and with multiple colors.

The new Lattice SIM technology of your Elyra 7 brings structured illumination microscopy (SIM) to a new level. Groundbreaking light efficiency gives you gentle superresolution imaging with incredibly high speed – at 255 fps you will get your data faster than ever before.

Elyra 7 lets you combine Lattice SIM with single molecule localization microscopy (SMLM) for techniques such as PALM, dSTORM and PAINT. You can now choose freely among your labels when imaging with resolution down to 20 nm laterally and 50 nm axially. High power laser lines allow you to image your sample with ease, from green to far red.

Elyra 7 is also very flexible: you can employ a wealth of contrasting techniques and combine them with optical sectioning. The new Apotome mode gives you superfast optical sectioning of your 3D samples. All that, plus Elyra 7 works seamlessly with your ZEISS SEMs in a correlative workflow.

Lattice SIM – Superfast and Gentle Superresolution
You can now use the novel Lattice SIM to uncover new mechanistic details and quantify the finest subcellular structures in large fields of view. This is a real breakthrough in light efficiency, enabling fast and gentle superresolution imaging of living specimens. Elyra 7 excels even more when it comes to fast imaging of 3D volumes at excellent z-resolution. Whether in 2D or 3D, by illuminating your samples with lower laser dosage, you minimize photodamage and so can observe fast cellular processes such as vesicle trafficking, membrane ruffling and signaling.

Optimized Localization Microscopy
Single molecule localization microscopy (SMLM) gives you access to molecular mechanisms in both fixed and living specimens. You can count molecules and come to understand, molecule-by-molecule, how individual proteins are arranged within a structural context. Elyra 7's SMLM module delivers molecular resolution in large 3D volumes and powerful post-processing algorithms for quantification. With its efficient dual camera detection and high power laser lines across the visible spectrum, you're free to choose dyes and markers for your experiments.

Freedom for Your Experiments
Elyra 7 allows you to choose and combine the best imaging techniques for your experiments, now and in the future. Select the modules you need today – Lattice SIM, SMLM or a combination of both – then expand your system later, as your needs grow. Elyra 7 is not just a superb superresolution system: it’s your flexible platform for live cell imaging, allowing you to match the spatial and temporal resolution perfectly to your applications. Upgrade your system anytime with a whole range of additional options. Or use ZEN imaging software and correlative microscopy workflows to combine your data with complementary imaging modalities.

Lattice SIM: U2Os cell expressing an mEmerald-GFP tagged endosomal transport marker (Rab5a) and tdTomato tagged Golgi and Golgi associated transport marker.

SMLM: Xenopus laevis A6 cells (epithelial kidney cells). Gp120, a nuclear pore complex protein arranged with eightfold symmetry was labeled with Alexa Fluor 647.
Your Insight into the Technology Behind It

Lattice SIM
In classic SIM, the sample area is illuminated and imaged with a grid pattern which changes direction and position. The grid structures interfere with structures in the sample, creating Moire fringes. These contain high frequency information – that is, high resolution information – transformed down to low frequencies that can be resolved by the microscope. The resulting image will have twice the resolution in all three dimensions.

In Lattice SIM, the sample area is illuminated with a lattice spot pattern instead of grid lines. The lattice pattern gives higher contrast and allows a more robust image reconstruction. Sampling efficiency is 2x higher than with classic SIM. As a result, you need less illumination.

It’s up to you how you use this improved photon efficiency. You can image faster with high image quality and low bleaching. Or get better image quality at the same speed and low bleaching. Or image more gently with high speed and image quality. It’s your choice.
Your Insight into the Technology Behind It

Elyra 7’s light-efficient Lattice SIM illumination pushes the boundaries of fast superresolution acquisition with minimized impact on the specimen. Lattice SIM provides optical sectioning and a doubling of diffraction-limited resolution in 3D (120 nm in xy and 300 nm in z). While ZEISS Elyra 7 provides optimal image quality and resolution across the entire visible spectrum with a large field-of-view, Elyra 7 with Lattice SIM gives you even more possibilities for increasing your image acquisition speed. Accelerate your acquisition of volumes by a factor of three, or push your 2D frame rate even further – up to 255 fps. You can precisely match the achievable spatial resolution and frame rate of Elyra 7 with all your scientific needs. Lattice SIM leaves you free to image faster and longer than ever before – without compromising on resolution.

**Capture Fast Dynamics**
Lattice SIM lets you observe biological processes with unprecedented speed in superresolution.

**Gentle Superresolution Imaging**
Reduce the light dosage on your specimen and still capture all the details – in multiple colors.

**Resolve the Finest Details**
Achieve optimal resolution across all wavelengths with multiple objectives.

---

Lattice SIM: U2Os cell expressing an mEmerald-GFP tagged endosomal transport marker (Rab5a) and tdTomato tagged golgi and golgi associated transport marker. The resulting images were acquired with a frame rate of >200 fps, allowing the detection of rapid events.

Lattice SIM: Tomm20-mEmerald and EB3-tdTomato in a U2Os cell were imaged simultaneously for more than 1400 frames.

Lattice SIM: Synaptonemal complex from mouse testis, spread on a coverslip. Sycp3 is labeled with Alexa Fluor 488 (green) and Sycp1 is labeled with Alexa Fluor 568 (magenta). Sample: courtesy of M. Spindler and R. Benavente, University of Würzburg, Germany.
In single molecule localization microscopy (SMLM), photo-switchable fluorescent molecules are sparsely activated so that only one out of many will be in its on-state within a single point spread function (PSF). This lets you determine its center of mass with a localization precision that far exceeds the extension of the PSF. Once recorded, the molecule is turned to its off-state – for example by photobleaching – and the cycle of activation / deactivation is repeated again and again until all molecules are captured. The localizations are plotted in a new image to create the superresolution image. If the PSF shape codes for the z-position, the method works in 3D as well. Expect to achieve resolutions in the range of 20 – 30 nm laterally and 50 – 80 nm axially.

With Elyra 7, powerful laser lines across the visible spectrum give you freedom to choose the best dyes for your experiments. Plus, the dual camera option with precise synchronization allows you to capture two labels simultaneously.
Your Insight into the Technology Behind It

Single-molecule localization microscopy (SMLM) encompasses techniques such as PALM, dSTORM, and PAINT. With high power lasers across the visible spectrum and dual camera detection, Elyra 7 allows researchers to gain access to a broad range of dyes, markers and fluorophores in almost any possible combination. Elyra 7 enables quantification with consistent precision over a large field-of-view and an unprecedented z-capture range. You can now acquire 3D data from a whole cell with molecular precision.

Resolve Molecular Structures
SMLM allows you to map precise locations of individual proteins.

Determine the Relationships Between Molecules
Detect two channels with molecular precision.

Capture Information in Three Dimensions
Untangle molecular relationships in z with confidence.

SMLM: Eightfold symmetry of the nuclear pore complex in A6 cells. Gp210 was labeled with Alexa Fluor 647. Widefield image (top left), SMLM image (top right) and zoomed in region (bottom).

SMLM: Alpha tubulin was labeled with Alexa 555 and beta tubulin with Alexa 488. The two channels were acquired simultaneously. The epitopes are either occupied by a green or red fluorophore – shown by the mutual exclusion between the green and the red signals.

SMLM: With Elyra 7 you can image a z-depth of 1.4 µm in a single acquisition. 3D SMLM image of Alexa 647 α-tubulin color coded for depth. Sample courtesy of Michael W. Davidson, Florida State University, USA.
Expand Your Possibilities

Get Superfast Optical Sectioning with the New Apotome Mode

You know the challenge: live cell imaging with a widefield system often suffers from out-of-focus blur or background signal. These effects can decrease contrast and resolution of your images. The new Apotome mode of your Elyra 7 now uses structured illumination to give you fast optical sectioning with crisp contrast and high lateral and axial resolution.

This is how it works. A grid pattern is used to illuminate and rapidly modulate the fluorescence signals in the focal plane of your microscope. After acquiring five images with different grid positions, a ZEN imaging software combines these frames into a resulting image which contains only information from the focal plane – your optical section. The new Apotome mode now allows you to perform fast and gentle live cell imaging with high contrast and resolution. Or, you can use your new optical sectioning speed to increase your productivity when acquiring large sample areas or big volumes.
## Tailored Precisely to Your Applications

- **Typical applications, typical samples**
- **Task**
- **ZEISS Elyra 7 offers**

### Live cell Imaging
- **Task**: Reveal mechanistic details in live cells, e.g. moving organelles, vesicle trafficking, membrane reorganization.
- **ZEISS Elyra 7 offers**
  - Lattice SIM allows fast, gentle and light-efficient imaging.
  - Lattice SIM: One-pass image acquisition over the full FOV (rather than multiple rotations) increases speed and reduces laser dosage.
  - Lattice SIM / SMLM: Samples stay in focus over time with Definite Focus 2.

### Resolve structural details in 3D and multiple colors.
- **Task**: Lattice SIM: Digital sectioning allows faster acquisition by reducing the number of z-slices while preserving the optical sectioning capability.
- **ZEISS Elyra 7 offers**
  - Lattice SIM / SMLM: Acquire two channels simultaneously and up to four colors (Lattice SIM) with optimized resolution for each wavelength. Duolink and optimized filter concept allow fast and aligned multiple-channel acquisition.

### Discover fast cellular processes in the context of whole cells.
- **Task**: Lattice SIM: Large FOV to capture a whole cell in one image.
- **ZEISS Elyra 7 offers**
  - Lattice SIM: Light-efficient illumination enables gentle observation of fast dynamics.
  - Incubation: Fully integrated incubation controls, temperature optimized oils, water immersion objective with correction collar.

### Observe fast dynamics of fine structures without perturbing the specimen.
- **Task**: Lattice SIM: Light-efficient illumination enables gentle observation of fast dynamics.
- **ZEISS Elyra 7 offers**
  - Incubation: Fully integrated incubation controls, temperature optimized oils, water immersion objective with correction collar.

### Track many molecules and retrieve diffusion behavior.
- **Task**: SMLM: Particle tracking over a large FOV allows for collection of diffusion information in entire cells. Camera limited temporal resolution.
- **ZEISS Elyra 7 offers**
  - SMLM: Powerful lasers across the visible spectrum and multi-emitter analysis reduce acquisition times and allow measurement of dynamics on the sub-minute timescale.

### Study molecular level structural changes of sub-minute-scale dynamic processes, e.g. mechanisms of focal adhesions, reorganization of tubulin, vesicle shuttling.
- **Task**: SMLM: Particle tracking over a large FOV allows for collection of diffusion information in entire cells. Camera limited temporal resolution.
- **ZEISS Elyra 7 offers**
  - SMLM: Powerful lasers across the visible spectrum and multi-emitter analysis reduce acquisition times and allow measurement of dynamics on the sub-minute timescale.

### Perform not only superresolution but also conventional live-cell imaging experiments such as recording membrane dynamics, cell division, cell migration.
- **Task**: Apotome mode, TIRF and conventional widefield fluorescence microscopy provide versatility.
- **ZEISS Elyra 7 offers**
  - Apotome mode, TIRF and conventional widefield fluorescence microscopy provide versatility.

### Large evolving organisms, such as Drosophila, C. elegans, Arabidopsis, Zebrfish, etc.
- **Task**: Resolve structural detail in 3D with high penetration depth.
- **ZEISS Elyra 7 offers**
  - Lattice SIM: Water objectives for deep tissue imaging.
  - Benefit from additional options such as optical sectioning, DIC, phase contrast.
  - Apotome mode for fast optical sectioning.

### Resolve structural details in 3D over large areas.
- **Task**: Lattice SIM: Tiling and stitching to cover large areas; level-adjustable stage to avoid sample tilt.

Lattice SIM: Observe cellular processes over long time periods without perturbing your specimen. U2Os cell expressing an mEmerald-GFP tagged endosomal transport marker (Rab5a) and tdTomato tagged golgi and golgi associated transport marker. Simultaneous dual-color acquisition over a period of 30 minutes.

Lattice SIM: Put high resolution details in the context of a whole cell. Cos7 cell expressing EB3-tdTomato. Sample courtesy of M. Sauer, University of Würzburg, Germany.

Lattice SIM: Resolve fast dynamics without photobleaching. U2Os cell expressing Lifeact-9 (labeling actin) and EB3-mEmerald-GFP (labeling growing ends of microtubules). Sequence of 100 images taken simultaneously in 2 colors. The motion of EB3 and Lifeact is followed with little appreciable photobleaching over the course of several minutes.

Lattice SIM: Observe the finest details. Actin labeled with Phalloidin. Widefield image (left) and Lattice SIM image (right) showing the two fold resolution improvement of Lattice SIM.

Lattice SIM: 3D volume image of Thy1-GFP neurons in a mouse brain section. A ~20 μm z-stack was acquired inside of the tissue section. Sample courtesy of Herms lab, DZNE, Munich, Germany.

Lattice SIM: 3D image of microtubules, color coded for depth.
ZEISS Elyra 7 at Work

SMLM is based on the ability to detect only one fluorophore at a time per diffraction limited area. Most often this is accomplished by using fluorophores which blink. 

Point Accumulation for Imaging in Nanoscale Topography (PAINT) is an alternative labeling approach in which "blinking" is accomplished through binding and unbinding of the fluorophores to the target of interest. This allows the use of bright dyes and eliminates bleaching, thus greatly improving SMLM results.

SMLM: 3D PAINT image of mitochondrial membranes in BSC1 (kidney epithelial cells). The outer membrane protein TOMM 20 was labeled using Ultivue – I2-650 imaging strand. Widefield image (left), 3D PAINT image color coded for z-depth (top right). Individual z-plane showing mitochondrial membrane structure (bottom right).
Your Flexible Choice of Components

1 Microscope
- Axio Observer 7 (inverse stand)
- Incubator XL dark and top stage incubation
- Motorized Piezo XY scanning stage
- Z-Piezo stage insert
- 2 camera ports or one camera port with Duolink

2 Objectives
- C-APOCHROMAT 63×/1.2 Water (DIC)
- Plan-APOCHROMAT 63×/1.4 Oil (DIC)
- Plan-APOCHROMAT 100×/1.46 Oil (DIC)
- Plan-APOCHROMAT 100×/1.57 Oil Hi Corr (DIC)
- alpha Plan-Apochromat 63×/1.46 Oil
- C-Apochromat 40×/1.2 W
- Plan-Apochromat 40×/1.4 Oil (DIC)

3 ZEISS Elyra 7 Illumination and Detection
- Fiber coupled solid state or diode pumped solid state lasers
- Available lines:
  405 nm diode (50 mW),
  488 nm OPSL (100 or 500 mW),
  561 nm OPSL (100 or 500 mW),
  642 nm diode (150 or 500 mW)
- Lasers shared between Lattice SIM and SMLM
- Andor iXon 897 EM-CCD camera (SMLM)
- PCO edge sCMOS camera
  (Lattice SIM, SMLM, Apotome mode)

4 Software
- ZEN (black edition)
- Lattice SIM/ Apotome module
- PALM/dSTORM module
- 3D-PALM module
System Overview
## Technical Specifications

### Microscope

- **Stand**: Axio Observer 7, motorized inverted microscope for superresolution microscopy
- **Z-drive**: DC servomotor, opto-electronically coded; smallest Z step 25 nm
- **XY Piezo Scanning Stage**: motorized; range 130 mm × 100 mm; max speed 100 mm/s; resolution 0.2 µm; reproducibility: ± 1 µm; absolute accuracy ± 5 µm; suitable for mounting frames K 160 × 110 mm and Z-Piezo Stage insert
- **Z-Piezo Stage insert**: for XY scanning stage, max travel range 100 µm; smallest Z step size 5 nm, sample holders available for standard 3”×1” slides LabTek chambers, multiwell plates and 36 mm glass-bottom dishes; level-adjustable and universal stage insert available for standard slides, glass-bottom dishes and LabTek™ chambers.

### Optical Filters for Lattice SIM and SMLM

- **Filter sets reflector turret**: Four exchangeable filter sets available for multi-channel Lattice SIM and SMLM; each filter set with four precisely mounted ACR-coded® filter modules for superresolution microscopy on a motorized six-position turret; two positions in each turret compatible with standard Push & Click filter modules, e.g. for visual sample observation.
- **Dual filter sets for Duolink optimized for dual color and double dual color applications**: Filter sets are optimized for dual camera applications, maximum sensitivity, minimal cross-talk and reduced autofluorescence.
- **Filter slider**: Manual filter slider with two positions (for emission filters or a Bertrand lens); fits into camera adapter of the microscope’s side port; emission filters exchangeable for customizing detection conditions.

### Lasers

- **Laser module for Elyra 7**: Laser coupling with polarization-maintaining single mode fiber (no adjustment of laser coupling by users required).
- **Laser Lines**: 405 nm (50 mW), 488 nm (100 mW or 500 mW), 561 nm (100 mW or 500 mW), 642 nm (150 mW or 500 mW); 405 laser can be attenuated by up to 100000 fold (used for activation and back-pumping); high power lasers (500 mW) can be 10 fold attenuated (488, 561, 642).

### Cameras

- **Camera for SMLM**: Andor iXon 897 back-thinned EMCCD camera; pixels: 512 × 512; pixel size: 16 µm × 16 µm; QE: 90 % (camera specifications by Andor)
- **Camera for Lattice SIM and SMLM**: pco.edge sCMOS camera; effective pixels: 1280 × 1280; pixel size 6.5 µm × 6.5 µm; QE: 82 %; dynamic range 15 bit (camera specifications by PCO); Liquid cooling system for EMCCD and sCMOS cameras.

Count on Service in the True Sense of the Word

Because the ZEISS microscope system is one of your most important tools, we make sure it is always ready to perform. What’s more, we’ll see to it that you are employing all the options that get the best from your microscope. You can choose from a range of service products, each delivered by highly qualified ZEISS specialists who will support you long beyond the purchase of your system. Our aim is to enable you to experience those special moments that inspire your work.

**Repair. Maintain. Optimize.**

Attain maximum uptime with your microscope. A ZEISS Protect Service Agreement lets you budget for operating costs, all the while reducing costly downtime and achieving the best results through the improved performance of your system. Choose from service agreements designed to give you a range of options and control levels. We’ll work with you to select the service program that addresses your system needs and usage requirements, in line with your organization’s standard practices.

Our service on-demand also brings you distinct advantages. ZEISS service staff will analyze issues at hand and resolve them – whether using remote maintenance software or working on site.

**Enhance Your Microscope System.**

Your ZEISS microscope system is designed for a variety of updates: open interfaces allow you to maintain a high technological level at all times. As a result you’ll work more efficiently now, while extending the productive lifetime of your microscope as new update possibilities come on stream.

Profit from the optimized performance of your microscope system with services from ZEISS – now and for years to come.
