CT LUCIA 601P / 601PY
Handling instructions
(China Version)
Preparing the
CT LUCIA 601P/601PY

Inject OVD\(^1\) into the front chamber of the injector body by inserting the syringe cannula into the lens holder opening. Fill to the forward end of the injector body (See arrow).

Check that the lens is in the correct position, central and secure in the loading chamber.

Inject OVD\(^1\) into the front chamber of the injector body by inserting the syringe cannula into the lens holder opening. Fill to the forward end of the injector body (See arrow).

To remove the lens positioning clip, place two fingers on the top surface of the lens holder and use your thumb underneath the clip to gently release the clip and lift the lens positioning clip straight up.

Close the lid of the loading chamber. When the "click-lock" mechanism is engaged, the lens is securely in place.

To advance the lens into the injector tip, gently press the plunger forward and push the lens into the conical tip of the injector, ensuring the lens moves smoothly forward. Retract the plunger slightly to separate the silicone cushion tip from the IOL and ensure the haptics are properly positioned. The IOL is now ready for implantation.

Implantation
During injection, press the injector plunger slowly forward. The IOL will slide smoothly into the eye.

\(^1\) We recommend to use ZEISS OVDs and OVD should be at room temperature.
