VISULAS YAG III
Precision laser workstation for secondary cataract and glaucoma therapy
The moment fascination with light inspires new treatments to preserve vision. **This is the moment we work for.**
The moment fascination with light inspires new treatments to preserve vision. This is the moment we work for.
Variable focus shift

Optimized energy

The high-precision Super-Gaussian beam profile of the VISULAS YAG III focuses the optimum amount of laser energy onto the point of treatment: only as much as necessary. This allows successful disruption – optical breakdown – to take place at just 2.5 mJ in air. In turn, this allows you to offer sensitive, high-precision treatment to your patients using a minimum of laser energy.

The pulse repetition frequency of 2.5 Hz also facilitates a fast workflow and short treatment times.

Fine adjustment of energy

Offering 22 levels of energy attenuation, the VISULAS YAG III provides ample flexibility for different treatment techniques. The fine gradations at the lower end of the output range permit optimum regulation of the laser energy for the sensitive, minimally invasive treatment of your patients.

Accurate focusing

The variable focus shift sets the focal point of the aiming beam precisely and reproducibly before, behind or directly at the focal point of the disruption laser. No more clumsy, manual de-focusing based on the position of the rear membrane. Thanks to this “safety distance”, damage to the tissue and intraocular lens during treatment is now also a thing of the past. This means greater comfort for you and your patients.

The ZEISS VISULAS® YAG III photodisruption laser brings together third-generation optical experience, technological excellence and a deep understanding of practical applications. Its superbly focused yet gentle cutting action has earned the device its reputation as the “sensitive scalpel” amongst secondary cataract lasers.
Optimized energy
The high-precision Super-Gaussian beam profile of the VISULAS YAG III focuses the optimum amount of laser energy onto the point of treatment: only as much as necessary. This allows successful disruption – optical breakdown – to take place at just 2.5 mJ in air. In turn, this allows you to offer sensitive, high-precision treatment to your patients using a minimum of laser energy. The pulse repetition frequency of 2.5 Hz also facilitates a fast workflow and short treatment times.

Accurate focusing
The variable focus shift sets the focal point of the aiming beam precisely and reproducibly before, behind or directly at the focal point of the disruption laser. No more clumsy, manual de-focusing based on the position of the rear membrane. Thanks to this “safety distance”, damage to the tissue and intraocular lens during treatment is now also a thing of the past. This means greater comfort for you and your patients.
VISULAS YAG III

For posterior capsulotomy or for iridotomy: the VISULAS® YAG III gets straight to the point. Its smooth power makes it ideal for use in ophthalmic practices – even busy ones with high patient volume.

Laser integrated slit lamp
The high-grade laser beam source of the VISULAS YAG III is fully integrated into the laser slit lamp. A top quality ZEISS product, the laser slit lamp was designed primarily for use in laser therapy, yet can also be used as a fully-equipped diagnostic slit lamp. Its lowered illumination prism, short corneal microscope and slim design make it ideal for daily clinical use.
Precision targeting
The unique 4-point aiming beam of the VISULAS YAG III ensures a high degree of aiming accuracy. Astigmatic distortions are clearly highlighted by the 4-point aiming beam and the selected energy level can be corrected accordingly before the laser beam is fired. The advantages are obvious: gentler treatment for your patients and extended lifetime for the laser source by avoiding "double firing".

Perfectly coordinated processes
The flexibly positionable control panel is the intelligent nerve centre of the VISULAS YAG III. Its compact format offers handy and convenient control of the user-friendly interface. The laser energy is always clearly visible on the illuminated and reflection-free touchscreen. The selected laser parameters can be finely adjusted using the ergonomically designed rotary knob.
VISULAS YAG III
Expanding the range of functions.

The VISULAS® YAG III is more than a disruption laser. It offers an outstanding range of diagnostic possibilities and permits high-precision examinations to be carried out immediately before and after treatment – without the need to move the patient. The extensive selection of optional accessories and the mobile transport case perfectly complement the laser’s wide functional scope.

Expanded insight
- The ACCENTO eyepiece for parameter adjustment allows you to maintain a clear overview of the treatment area and the levels of energy applied or the treatment parameters during the entire laser therapy.
- The oblique viewing angle of the ACCENTO ergo tube allows you to administer treatment in a comfortable and relaxed position – even after several hours of laser therapy.
- The VISULAS YAG III also features a monocular co-observation tube for training and consultation purposes. The DigiCam Adapter, which allows standard camcorders and digital cameras to be connected, is designed for demonstrations to larger groups and digital documentation.

ACCENTO eyepiece with parameters displayed into field of view
Expanded diagnosis

- The AT 030 applanation tonometer extends the diagnostic capacities of your laser slit lamp. It permits direct measurement of the intraocular pressure without the need to move the patient.

- The high-grade contact lenses for therapeutic laser applications – such as capsulotomy, iridotomy, trabeculoplasty or for observation of the fundus – have an optimized anti-reflective coating suitable for all common laser wavelengths.

Expanded protection

- The laser safety goggles for the YAG laser wavelength of 1064 nm provide appropriate DIN EN 207 standard protection, have an attractive design and are very comfortable to wear.

- The laser warning lamp outside the laser treatment room clearly indicates when the laser is switched on and warns unauthorized persons not to enter the treatment zone.

- The carrying case can be used to store and transport your laser plus accessories to the next location – keeping them well protected at all times.
VISULAS YAG III Combi
Laser therapy at both poles.
Compact. Comfortable. Consistent.

The VISULAS® YAG III Combi is the “multi-purpose” laser for photocoagulation and secondary cataract treatment and for established glaucoma therapies. At the push of a button you can switch between posterior and anterior laser treatment – a space-saving and efficient solution.

Space-saving and flexible
The VISULAS YAG III Combi is a high-performance dual device which is designed for use even in rooms where space is at a premium, both lasers – the VISULAS YAG III and the VISULAS 532s – fit snugly beneath the instrument table, freeing up a large amount of space and ensuring ample freedom of movement. Both lasers also function effectively as individual units. The VISULAS 532s can be used in the operating room while the VISULAS YAG III can continue to be used with the combi slit lamp.
Clear and simple controls
The treatment parameters for both lasers are set using the central control panel. With its clear structure and simple, symbol-based buttons, the graphic user interface simplifies your daily work. All the treatment parameters are conveniently displayed at your finger-tips. The electronic micromanipulator integrated into the joystick of the Combi slit lamp is used to control the coagulation laser – quickly and precisely. Naturally, the trigger button for the YAG laser is built into the slit lamp joystick.

Key and impressive details
The VISULAS YAG III Combi was designed for frequently alternating laser applications. The effective combination of both laser sources in the exclusive ZEISS slit lamp design is impressive on account of many useful features:

- The appropriate true-to-color physician’s safety filter for the selected application is always active.
- The symmetrical arrangement of the control elements makes all slit lamp functions are ergonomically accessible.
- The coagulation laser is always visible in the center of the illuminated treatment zone thanks to the coaxial illumination and electronic micromanipulator.
- The parfocal system always shows the laser spot sharply in the target area, ensuring homogenous and reproducible coagulation centers.
Space is often limited in many busy doctors’ practices and clinics. For the first time the VISULAS® Trion Combi bundles four different treatment wavelengths in a single device – for even greater efficiency in the smallest of spaces.

**VISULAS Trion Combi**
Impressive flexibility.

**Four wavelengths.**
**Three treatments. Two poles.**
The VISULAS Trion Combi integrates the professional laser treatment techniques for both the anterior and posterior eye segment. It combines the multi-wavelength VISULAS Trion laser for posterior photocoagulation with the VISULAS YAG III laser for anterior photodisruption. For the first time this provides you with four different wavelengths for the three most common therapeutic laser applications in a single compact workstation.
Detachable display of VISULAS Trion Combi 20g, 23g, 25g *

Four wavelengths. Three treatments. Two poles. The VISULAS Trion Combi integrates the professional laser treatment techniques for both the anterior and posterior eye segment. It combines the multi-wavelength VISULAS Trion laser for posterior photocoagulation with the VISULAS YAG III laser for anterior photodisruption. For the first time this provides you with four different wavelengths for the three most common therapeutic laser applications in a single compact workstation.

One applicator. One control panel. One workflow. The Trion Combi laser slit lamp is the joint applicator for both lasers. It is compact and also does away with the need for time-consuming changes or relocation of the patient. The greatest strength of the VISULAS Trion Combi is apparent when performing iridotomies with pre-coagulation: a single touch of the laser display switches the interface from coagulation to disruption mode. The coagulation laser is controlled quickly and accurately using the joystick-integrated electronic micromanipulator. Naturally, the trigger for the YAG laser is incorporated in the slit lamp joystick.

One slit lamp. Four filters. Full image quality. But the Trion Combi laser slit lamp has even more to offer: as a powerful diagnostic slit lamp it further extends the range of possibilities of your VISULAS Trion Combi.

One investment. Many possibilities. The VISULAS Trion Combi gives you the full range offered by a versatile coagulation laser for the treatment of retinal disorders. Its three different colors mean that you always have the appropriate wavelength for all clinical cases at your disposal. The VISULAS YAG III laser is perfectly designed for applications in the anterior segment. Capsulotomies can be carried out accurately and with minimum discomfort to the patient, using the lowest possible levels of power.

* Not for sale in the U.S.
